**PATENT APPLICATION  
DOCKET NO. 10001448-1**

**IMPROVED MOPYMULTIPLE-ORIGINAL-OUTPUT CONTROL FOR  
MULTIFUNCTION DEVICES**

**INVENTOR(S):**

C. Kevin McIntyre

00728007-120100

1 **IMPROVED MOPYMULTIPLE-ORIGINAL-OUTPUT CONTROL FOR**  
2 **MULTIFUNCTION DEVICES**

3  
4 **TECHNICAL FIELD**

5 This invention generally relates to an improved technology for  
6 controlling Mopymultiple-original-output ("Mopying") on multifunction  
7 devices (MFDs). More particularly, this invention generally relates to an  
8 improved technology for controlling source and destination of specific outputs  
9 of a multiple-original-output job on MFDs.

10  
11 **BACKGROUND**

12  
13 **Mopying**

14 The term "Mopy" is short for a function often called "Multiple Original  
15 Copies", "Multiple Original Prints", or "Multiple Original Output". A Mopy-  
16 enabled product produces "Mopies," whereas a photocopier produces copies.

17 Advances in digital technology have created a trend towards reliable,  
18 affordable multifunction equipment in place of traditional stand-alone, single  
19 purpose devices like photocopiers and fax machines. While the need for  
20 copying will continue to exist, more complete multifunctional solutions are  
21 being developed that will substitute for or replace traditional photocopier and  
22 fax devices.

23 To Mopy, a computer user, typically, sets an option to print a given  
24 number of copies of a document via an application or a printer driver interface.  
25 However, use of conventional non-mopied printers for Mopying can cause a  
slower return to applications for users as the computer generates multiple

09728097 120400

1 collated sets on the host, which results in higher network traffic as the file size  
2 increases.

3 Mopy-enabled printers utilize intelligent firmware and host software to  
4 improve throughput and eliminate the issues above. The printer driver transmits  
5 the file only once and sends appropriate header information (e.g., the number  
6 of copies) to the printer for rasterization and spooling. The printer rasterizes the  
7 job only once and then prints multiple, original copies in the manner  
8 determined by a user. Mopy printing is particularly useful for complex jobs that  
9 slow down the printer when the first copy is created or takes a long time to  
10 transmit over a network.

11 Mopying allows users to take advantage of the advanced processing and  
12 finishing capabilities of the printer, instead of burdening their own computer  
13 and the network. Compared to traditional alternatives like making copies on  
14 photocopiers, Mopying results in a more efficient, productive work process; the  
15 sharp quality of a first generation document (rather than a copy); increased  
16 reliability; and the convenience of desktop control and management.

### 17 **Multifunction Devices**

18  
19 Generally, a Mopy-enabled printer is a printer that produces multiple  
20 original prints. Mopying a document reduces the amount of data sent to the  
21 printer, which provides a faster return to the application and reduces network  
22 traffic. Examples of Mopy-enabled printers include: The Hewlett-Packard  
23 Company (henceforth "HP") LaserJet™ 4000, 5000, 4050, 8000, 8100 Series  
24 printers.

25 Many of the existing Mopy-enabled printers are also multifunction  
devices (MFDs). As the name implies, a MFD is a device capable multiple  
functions. Most of the functions are related to printing, paper handling, or data

1 communication. Examples of the functions performed by a MFD include (but  
2 are not limited to):

- 3 • printing;
- 4 • Mopying;
- 5 • copying;
- 6 • send/receive fax;
- 7 • send/receive e-mail;
- 8 • image acquisition;
- 9 • text recognition;
- 10 • source paper handling (such as high capacity input (HCI); trays  
11 having differing paper sizes/types; envelope trays);
- 12 • destination paper handling (such as stacking; stapling; sorting;  
13 collating; mailboxes);
- 14 • data acquisition (network; serial; USB; parallel; IR; floppy disk;  
15 hard disk; RAM; flash cards; any other media).

16  
17 Fig. 1 illustrates a conventional Mopying scenario 100. A client  
18 computer 102, as directed by a user 104, sends a print job 106 to a MFD 110  
19 via a network 108. A print job directs a printer to print a document (consisting  
20 of one or more pages). Using the printer driver, the user 104 directs the MFD  
21 110 to print multiple original copies (i.e., Mopies) of each page in print job  
22 106. Thus, print job 106 may be referred to as a Mopy job 106. A Mopy job  
23 directs a printer to print a document (consisting of one or more pages) multiple  
24 times, but the document is sent to the printer only once and is only rasterized  
25 once.

As is conventional, the MFD 110 pulls paper from a single source 120,  
such as an input stack 122. There may be multiple sources available, but each

09728097 120100

1 page of a Mopy is only pulled from one source although a particular Mopy job  
2 may use multiple sources. Examples of such sources include a tray of legal  
3 sized paper; a tray of letter sized paper; a tray of blue paper; an envelope tray;  
4 etc.

5 Likewise, the MFD 110 sends the printed Mopies to a single destination  
6 130, such as an output stack 132. There may be multiple destinations available,  
7 but each page of a Mopy is only delivered to one destination. Examples of such  
8 destinations include a paper stacker; a paper stapler; a mailbox; e-mail; fax; etc.

9 Although these Mopy-enabled multifunction devices have a large array  
10 of functions, users of such devices are conventionally restricted from fully  
11 utilizing all of the capability of such devices or instructing individual Mopies  
12 fro/from different devices.

### 13 SUMMARY

14  
15 Described herein is an improved Multiple-Original-Output ("Mopying")  
16 control technology for multifunction devices (MFDs). Such technology  
17 enables a user at a computer to fully control and access the functions of a  
18 Mopy-enabled MFD. With this technology, the user fully controls the source  
19 (e.g. data and paper) for each Mopy of a Mopy job. Similarly, the user fully  
20 controls the destination (e.g. paper and communications) for each Mopy of a  
21 Mopy job.

22 This summary itself is not intended to limit the scope of this patent. For  
23 a better understanding of the present invention, please see the following  
24 detailed description and appending claims, taken in conjunction with the  
25 accompanying drawings. The scope of the present invention is pointed out in  
the appending claims.

097280097 " 420100

1 **BRIEF DESCRIPTION OF THE DRAWINGS**

2 The same numbers are used throughout the drawings to reference like  
3 elements and features.

4 Fig. 1 is a schematic diagram of a multifunction device (MFD) on a  
5 network with a client. This diagram illustrates a conventional Mopying  
6 scenario.

7 Fig. 2 is a schematic diagram of a multifunction device (MFD) on a  
8 network with a client. This diagram illustrates an example of a Mopying  
9 scenario in accordance with an implementation of the invention claimed herein.

10 Fig. 3 is a block diagram of an exemplary system in accordance with an  
11 implementation of the invention claimed herein.

12 Fig. 4 is a flow diagram of an example of a methodological  
13 implementation of the invention claimed herein.

14  
15 **DETAILED DESCRIPTION**

16 The following description sets forth specific embodiments of an  
17 improved multiple-original-output ("Mopying") control for multifunction  
18 devices that incorporate elements recited in the appended claims. These  
19 embodiments are described with specificity in order to meet statutory written  
20 description, enablement, and best-mode requirements. However, the  
21 description itself is not intended to limit the scope of this patent.

22 Described herein are one or more exemplary implementations of an  
23 improved Mopying control for multifunction devices. The inventor intends  
24 these exemplary implementations to be examples. The inventor does not intend  
25 these exemplary implementations to limit the scope of the claimed present  
invention. Rather, the inventor has contemplated that the claimed present

1 invention might also be embodied and implemented in other ways, in  
2 conjunction with other present or future technologies.

3 An example of an embodiment of an improved Mopying control for  
4 multifunction devices may be referred to as an "exemplary Mopying control."

### 5 6 Exemplary Mopying Control Scenario

7 Fig. 2 illustrates an exemplary scenario 200 in which an exemplary  
8 Mopying control is implemented. A client computer 202, as directed by a user  
9 204, sends a Mopy job 206 to a MFD 210 via a network 208. Using a printer  
10 driver, the user 204 directs the MFD 210 to print multiple original copies (i.e.,  
11 Mopies) of each page in job 206. Thus, job 206 is a Mopy job 226.

12 In the exemplary scenario, the user 204 would like for each of the  
13 Mopies of the Mopy job 206 to pull paper in from different sources 220. For  
14 example:

- 15 • One Mopy on white, draft, letter-sized paper 222;
- 16 • Another Mopy on blue, draft, letter-sized paper 224;
- 17 • Still another Mopy on bond, letter-sized paper 226; and
- 18 • Further still another Mopy on a transparency (not shown).

19 Furthermore, the user 204 would like for the Mopies to have multiple  
20 destinations 230. In other words, not all of the Mopies are stacked together.

21 For example:

- 22 • One Mopy stacked in the regular destination stacks 238;
- 23 • Another sent to a mailbox 236 of a specific person;
- 24 • Still another 232 sent via e-mail 234 (thus, it need never be  
25 physically printed);
- Further still another sent via fax (not shown)

1 If this were a conventional scenario as shown in Fig. 1, the MFD 210  
2 would pull paper from a single source. Likewise, if this were a conventional  
3 scenario, the MFD 210 would send the printed Mopies to a single destination.

4 To satisfy his Mopying needs listed, the user 202 most likely will not  
5 employ the Mopying function of the MFD. Since the user is forced to live with  
6 no source and destination choices, the user is likely to print one copy and  
7 manually copy on a photocopier the document onto other types of paper. The  
8 user will manually fax a printed document. The user will manually email the  
9 document. The user will manually place copies in the mailboxes of others.

10 However, in the exemplary scenario 200 of Fig. 2, in which an  
11 exemplary Mopying control is implemented, the user 202 has options to select  
12 one or more sources 220 and one or more destinations 230. The user is given  
13 the option to select such sources and destinations via a printer dialog box (e.g.,  
14 graphical user interface) on the client 204. Such a dialog box may be provided  
15 by an application or a printer driver.

16 Examples of the sources (data and physical media, such as paper) that  
17 may be selected by a user include (but are not limited to):

- 18 • received fax;
- 19 • an e-mail;
- 20 • image acquisition (e.g., scanner);
- 21 • text recognition for a source image;
- 22 • high capacity input (HCI);
- 23 • trays having differing paper sizes/types;
- 24 • envelope trays;
- 25 • an electronic source (for data) and no paper when the destination  
is electronic;

- data acquisition (network; serial; USB; parallel; IR; floppy disk; hard disk; RAM; scanner; flash cards; any other media).

Examples of the destinations (data and physical media, such as paper) that may be selected by a user include (but are not limited to):

- sending fax;
- sending e-mail;
- stacking;
- stapling;
- sorters;
- collating;
- high capacity output (HCO)
- mailboxes;
- data transmission (network; serial; USB; parallel; IR; floppy disk; hard disk; RAM; flash cards; any other media).

Furthermore, the user 204 can build a customized profile to configure a standard Mopying control. The user presumably names or identifies the profiles. The profiles may be saved in a secondary non-volatile memory (e.g., hard drive) of a client (or server). When the user wishes to direct the MFD in standard manner, the user invokes the saved profile to do so. This may be called "Mopy job profiling."

### **Exemplary Mopying Control**

Fig. 3 shows a schematic block diagram of the exemplary Mopying control at the client and at the MFD. Mopy control system 300 includes I/O unit 310, source-selection determiner 320, destination-selection determiner

1 330, Mopy-job formatter 340, and Mopy-job transmitter 350. The Mopy  
2 control system may be implemented as part of a printer driver, application,  
3 operating system, or the like.

4 The I/O unit 310 receives input from the user. It may also present a GUI  
5 for the user. The user's source-selections are determined by the source-  
6 selection determiner 320. Likewise, the user's destination-selections are  
7 determined by the destination-selection determiner 330. These are sources and  
8 destinations on a MFD.

9 These determined selections are included in the Mopy job, which is  
10 generated and formatted by the Mopy-job formatter 340. The Mopy-job  
11 transmitter 350 sends this job via a network 360 to a MFD 370.

12 The MFD 370 includes a receiver 372, a conventional print engine 378,  
13 multiple sources 374 (such as those listed above), and multiple destinations 376  
14 (such as those listed above).

15 The receiver 372 receives the Mopy job and transfers it to the print  
16 engine 378. The print engine prints the Mopies of the Mopy job. In doing so,  
17 it selects the designated source for each Mopy. Likewise, it selects the  
18 designated destination for each Mopy.

#### 19 20 **Methodological Implementation of the Exemplary Mopying Control**

21 Fig. 4 shows methodological implementation of the exemplary Mopy-  
22 control performed by the MFD 210 (or some portion thereof) and/or client 204  
23 (or some portion thereof). This methodological implementation may be  
24 performed in software, hardware, or a combination thereof.

25 At 410 of Fig. 4, the Mopying control presents a GUI (graphical user  
interface) to the user once the user has requested to print to a MFD. Such GUI  
includes an option for Mopy. It also includes options for selecting the source

00728097 1204100

1 of each Mopy of a Mopy job. Furthermore, it includes options for selecting the  
2 destination of each Mopy of a Mopy job. In may also include a mechanism to  
3 save and retrieve Mopy job profiles. The user may select a profile; select  
4 amongst the various source/destination options; or a combination of both.

5 At 412, the client sends a Mopy job to the MFD. The Mopy job  
6 includes Mopying-control directions that specify the source and destination of  
7 each Mopy in a Mopy job.

8 At 414, the MFD processes such directions and prints the Mopy job  
9 accordingly. At 416, the process ends.

10  
11 **Conclusion**

12 Although the invention has been described in language specific to  
13 structural features and/or methodological steps, it is to be understood that the  
14 invention defined in the appended claims is not necessarily limited to the  
15 specific features or steps described. Rather, the specific features and steps are  
16 disclosed as preferred forms of implementing the claimed invention.
